## SPECIAL OFFER

From 01/07 to 15/08 2024

2024  
07  
July

# OUR DEAR PARTNER!

**József Hajdú**  
founding owner,  
executive manager

For more than 35 years, BIONIKA has been dedicated to producing implants with a germ-free, „super-clean” surface that reduces the risk of rejection and contributes to the success of the procedure. Since the company’s establishment, we have placed great emphasis on the design and cleanliness of the implant surface, considering biological aspects. In the case of dental implants, we believe that titanium is the most suitable material for creating a dental root-like structure.

This is mainly because it is the only material of high strength and purity on which bone cells can glide and stabilize after implantation in the jawbone. According to most publications, the incidence of rejection in medical practice is generally around 3-5%. Higher failure rates may occur due to various patient diseases, such as diabetes or hypertension, and even severe flu can lead to implant loss during the healing phase. So-called endotoxins (dead bacterial cells) adhering to the surface of the implant can easily lead to nodal foci in the body. We are addressing this issue with our „super-clean” implant surface, which achieves 99% osseointegration, significantly improving implant quality and reliability.
