*A genuine smile comes from heart.
Our job is to make it shine on the outside too!*

WELCOME

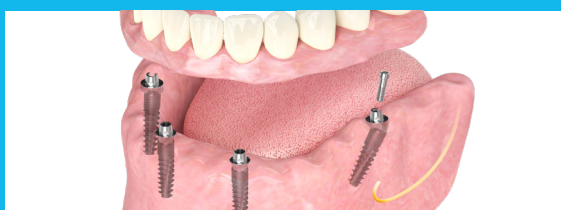

Today, nearly 20% of the global population is partially or completely edentulous. These patients seek an aesthetic and stable solution, but due to financial constraints, they cannot always afford the most advanced implant procedures. For them, BIONIKA's „Optimum” solution — based on 4 implants — can be an excellent solution.

József Hajdú
founding owner,
executive manager

Why do patients prefer the Optimum solution?

- Fewer implants, greater stability:
The restoration requires only 4 implants, placing less strain on the body.

- Immediate loading:
Patients can enjoy the benefits of removable or fixed dentures just a few days after the procedure.
- Aesthetic and natural effect:
This solution closely mimics the appearance and function of natural teeth.
- Why is it beneficial for professionals?
- Wide prosthetic options:
The Optimum solution allows for both removable and screw-retained prostheses, making individualized solutions possible for every patient.
- Quick and efficient procedure:
Since the method doesn't require bone grafting, surgical time and follow-up treatments are significantly reduced.
- Cost-effective solution:
With BIONIKA's discounted implants and components, fixed dentures become more affordable. This makes the procedure accessible to cost-sensitive patients and helps practices reach a broader clientele.

Try the Optimum solution and discover how it can make fixed dental restorations simpler, faster, and more accessible for your patients!

dentCAM

MILLING CENTER

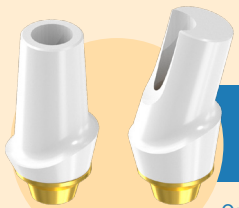

Flexi (PCT) Base

Provides a precise connection between the implant and the restoration when the base material does not offer sufficient stability. Commonly used for plastic and zirconia dentures. Thanks to its stepped design, it can also be used for angled screw-retained crowns.

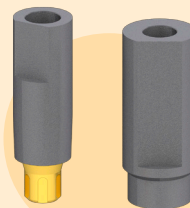

Titanium Base

Provides a precise connection between the implant and the restoration when the base material does not offer sufficient stability. Commonly used for plastic and zirconia dentures.

Zirconia abutments on Ti-base

Our zirconia abutments are available for all UNIFORM systems. Sizes may vary depending on the system. Custom-designed zirconia crowns are available.

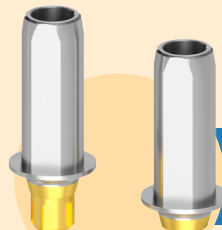

Scanbody

A CAD/CAM component required for 3D scanning, used to determine the 3D position of implants. Available in both implant-level and multi-unit versions.

Interface

Transform your implant with an interface! Its function is to purposefully modify the connection between the implant and the restoration. It converts the implant to the Brånemark external hex connection system. The advantage is easy execution of bridges.

Tube abutment

An alternative to a zirconia base with an extended tube design. It can be custom-trimmed to fit the crown. Its stepped design also enables paracentric (PCT) screw-retention.
