executive manager

The SLIM family, which received ORKI approval in 1993, is a complex system designed to provide solutions for all emerging implantological requirements and challenges. I highlight this system because the solution based on the constructional geometric elements of the Bauer screw still appears to be one of the most competitive among one-phase constructions today.

The first member of the system was SLIM Flexible, which inherited the characteristics, geometry, and surgical properties of the original Bauer screw (cycloid-conical shape, self-compressive thread structure, flexible zone), with a design that can also be bent intraorally during implantation.

By extending the flexible zone while maintaining the thread-groove geometry of the system, and following the model of the BC screw developed by the company Oraltronic, a version was created within the SLIM family featuring wide and deep thread grooves with thin thread crests. This version was later named Speedy.

Within BIONIKA's product portfolio, screw-retained solutions are playing an increasingly important role in response to market demand. By adapting multi-unit solutions used in the abutments of two-phase implant systems, we created the SLIM Compact version, which significantly expands the application possibilities of the SLIM family — enabling not only cemented prosthetic restorations but also the wide-ranging use of screw-retained solutions.

With this development, we aim to meet the most critical challenge of modern dentistry: the pressure of time — above all, in the best interest of patients.

PRECISION MEETS INNOVATION

Complete Digital Solutions for Modern Implant Dentistry

Zirconia • Titanium • Digital CAD/CAM Expertise

**BIONIKA**

## ***Slim – A flexible implant family***

Suitable for average-density and softer bone structures as well. The procedure can be performed with minimal surgical exposure, or even transgingivally. An optimal design for immediate loading.

Features:

- **Radius-shaped thread edge design**
- **Cycloid thread profile**
- **Large thread pitch**
- **Deep thread depth**
- **Tapered, self-compressing thread adapted to the natural tooth root shape**
- **Thin, sharp, conical apex**

## ***Speedy – When flexibility and bicortical support matter***

Due to its distinctive characteristics, the SPEEDY Implant System is one of the most suitable solutions not only for average-density bone, but also for softer bone structures. Meeting the requirements of minimally invasive surgery, the procedure can be performed with minimal exposure, or even transgingivally.

Features:

- **Flexible aesthetic head design (0–35°)**
- **Platform switching below the bendable neck, with RadialFix grooves**
- **Anti-rotation cutting edge**
- **Radius-shaped thread edge design**
- **Cycloid thread profile**
- **Large thread pitch**
- **Deep thread depth**
- **Tapered, self-compressing thread adapted to the natural tooth root shape**
- **Thin, sharp, conical apex**
