BIONIKA for a thriving connection

WELCOME

József Hajdú
founding owner,
executive manager

You may have wondered what factors differentiate a premium implant from its conventional counterpart. A strong brand name, a well-constructed marketing strategy and monumental exhibition stands can indeed help a product to become well known, but true quality, effectiveness and reliability depend on the fundamental characteristics of the product. According to the BIONIKA Team, the conscious use of experience gained through continuous research and development, the use of industry-recognized technologies and the use of excellent raw materials are essential in the production of premium implants. This is why our products are developed

in collaboration with doctors and engineers, in line with the ever-changing market trends and needs. This collaboration has resulted in the SCANDREA Implant System, a premium implant system that is proven and popular in both the domestic and Swedish markets, and which meets all the requirements and expectations of implantology. The SCANDREA implant system is a premium product due to its high quality, special product features and advanced technology. With a long-term guarantee, the product has the design, mechanical, and material properties that the profession expects from modern innovative products and is therefore highly recommended to all dental colleagues and patients at home and abroad.

PREMIUM solution with 20 years of experience to meet the highest standards

Conical-Connection

We use a connection that results in micromotion-free force transmission and provides favorable conditions for accurate impression taking.

Cortical Level

The chances of implant retention are significantly improved if the upper rim of the implant is placed at or below the cortical level.

Platform switching

The diameter of the abutment attached to the implant is smaller than the outer part of the implant attached to the bone, so that the bone can slide onto the upper rim of the implant.

Spirally micro-grooved surface

The micro-grooved spiral surface acts as a significant load-bearing element. The self-locking thread structure and the cycloidal threading ensure a micromovement-free state and rapid insertion.

Anatomical tooth root shape

The implant's screw thread taper, high thread pitch and thread depth, self-locking and self-tapping design provide bone compression and, with care, immediate loading.

Rounded implant end

Facilitates minor changes of direction when inserting the implant and provides extra stability.

Choose premium quality, we will inspire you!
